Date: August 9, 2020

Contact: Jess Walker

Performed by: Chip McAslan (Lavo Solutions)

ABOUT OUR PROCESS

- Fogging is a great way to disinfect many touch points quickly (floors, soft surfaces, mats, etc) that normally do not get wiped down
- Important to remember that this is about your long term cleaning protocol...not a magic bullet!
- ATP testing (measured in RLUs) is done to detect the amount of organic matter that remains after cleaning a surface
- RLU under 60 is generally considered food-grade sanitary...under 100 is a reasonable target for an office
- We used a food safe, hospital grade disinfectant with a 10 minute dwell time to kill most bacteria and virus
- We used 7 gallons of chemical product, or the equivalent of 28 spray bottles!
- We use the same process for the office and sampled several high touch points to evaluate success of the entire service.

RESULTS

- We fogged the facility (to kill microbes) then wiped high touch surfaces to ensure disinfection.
- Average after cleaning RLU was 18! This is surgical instrument clean!
- Always remember to hit tops, bottoms, sides for chairs, door handles, buttons, etc...especially in the kitchen!

Locations	BEFORE	TARGET	AFTER	% Reduction	NOTES
cube middle near black pillar	109	100	13	88%	Normal starting point with little use
cube near pillar purple chair	157	100	3	98%	
front light switches	277	100	55	80%	Don't forget bottoms / sides of switches!
fridge door handle	249	100	29	88%	The indentation of the handle traps germs
door handle office near conf room	158	100	6	96%	
elevator buttons	242	100	2	99%	Don't forget the germs we bring in!
Averages	199		18	91%	

Total Microbe Reduction

91%

Recommendations

1 - The overall starting numbers were relatively low...this is normal given that there have not been many people in the facility. These low numbers helped ensure that our ending results were surgical instrument grade clean (under 30) for nearly every surface.

2 - We applaud you for adding a layer of Shield! This will help keep your surfaces clean for up to 90 days. All surfaces are now actively killing microbes + ongoing cleaning practices will be more effective. We recommend starting a regular treatment every 60-90 days to maintain your newly disinfected surfaces!

Thanks for letting us serve you and please pass along the word to any other offices, gyms, restaurants, hotels, etc looking for a similar result!
